

BS5837 Tree Survey (TS)

“The first step in land development around trees.”

A BS5837 Tree Survey provides a breakdown of the tree population within an area of potential development.

Trees are plotted and categorised in line with BS5837:2012 with dimensional measurements taken to later inform the design and location of installations within the proposed site.

Top tip from our Surveyors:

“For an increased chance of an efficient and stress-free process from plan to completion, the investment in an accurate topographical survey showing the stem markings from the beginning of the process has proven itself invaluable.”
